

Control Problems In Industry

The Ten Fundamental Truths of Process Control

1. You can't fix what you can't find. You can't control what you can't measure.
2. It is always more cost-effective to over-inspect than to under-inspect.
3. The most expensive defect is the one that wasn't detected inline.
4. Always quantify your lots at risk when making changes to your process control strategy.
5. Variability is the enemy of a well-controlled process.
6. Time is the enemy of profitability.
7. Improving yield also improves device reliability.
8. Process control requirements increase with each design rule.
9. High-stakes problems require a layered process control strategy.
10. Adding process control *reduces* production costs and cycle time.
